In the increasing number of populations, the need for digitization and reducing human effort has become a need. Digitization helps to use time more efficiently. The basic attraction of any automated system is reducing human labor, efforts, time and errors due to human negligence. Previously we used to have a manual hard copy of records but now we prefer having everything in our laptop, we prefer to search specific data by touching few keys, we want to have everything at our screen. This project is about developing an online system where the counselling of user can take place and can update regularly. This project is chosen to save time and resources of employees as well as user and to overcome the existing drawbacks in maintaining records. This project can be used by the main system admin, employee and user who can update specific assigned usability data regularly.

Keywords: Digitization, Online Counselling.

I. INTRODUCTION

Student's Counselling is the process that includes different types of activities such as guiding user of colleges and universities, supporting them in academics, providing full guidance in getting the information related to their future career. Almost all existing counselling is done manually based where there is a huge involvement of traditional methods like humans and paperwork which consumes more time, complicated process, counselling more user is a complex task, difficulties in test evaluations, risks in data management and many more. This online student counselling system even gives great support to

universities and colleges through which they can totally reduce the paper usage for counselling and guiding the user towards their future. In this system there is three modules namely Admin, Employee and User. Admin can login using his id and password. Admin can add, update, delete and view employee. Admin can view and delete student. Employee can login using credentials. Employee can view and delete student. Employee can give feedback to admin regarding any changes or edit in user' list or any system problem. Student can give basic details like Email & Contact number verification by OTP to get registered and can login be using credentials. Student can Update Basic details, Address Details, Physical

details, Govt ids, Parent details, Academic Details & Fees Details. Student can change their password in case of an emergency. Student can add Feedback to Employee or Admin.

II. RELATED WORKS

Web-based evaluation system for online courses and Learning Management Systems: In this paper the authors use a design and create research approach to implement a system for student online counseling with adaptive feedback, the Student Online Counseling Kernel System (SOCKS). This system is based on observation of the learning behavior, i.e. the time spent for studying learning units and related test performance, and has a component to predict the learning outcomes of individual user during an online course and prior to final exams. The main objective of SOCKS is to give user an automatic and immediate response to monitored attendance and quiz/test results after having finished a learning unit composed of standardized learning objects. The prediction process is based on a statistical model of learning performance and test performance. The resulting response is an overview of student activities in various sections of the online course. The system not only monitors the learning behavior but also give comments and feedbacks to an individual student. It can deal with comprehensive as well as selective or topic driven tests based on random questions from a test repository. Results are given and discussed.

SQL Injection attacks and some tips on how to prevent them: This paper proposes techniques to detect the vulnerabilities by performing scanning process for all website and web applications. The revealing process for vulnerabilities in ASP.NET websites/ applications is a complex process, where most of the code is anonymous and there are no citations to determine the purpose of the code. Due to the fact that ASP.NET which is part of .NET framework that separate the HTML code from the

programming code in two files, one for (aspx) file and another for the programming code depending on the compiled language Visual Basic, C#, Java Script. Since the VB and C# are the most common languages in use around the world with ASP.NET files, we have adopted these two compiled languages in the construction of our proposed algorithm in addition to aspx files. Therefore, the scanning process inspects at least those three types of files aspx, VB and C#.

Using Internet technology to improve and simplify counseling about menopause: The WISDOM website:

Although much attention has been given to measuring the risks associated with menopausal hormone therapy (HT), decisions about HT should be guided largely by individual patient preferences and values. Because the magnitude of the risks associated with HT for healthy 50-year-old women are exceedingly small (typically <1 in 1000) and its impact on survival are negligible, patient preferences and values become the most critical considerations. To make a rational and informed decision about HT, a woman needs to weigh any short-term gains in quality of life from HT against its longer term risks. To do this, clinicians need to gauge the patient's risks for the conditions affected by HT, the effects of HT on these risks, understand the woman's menopausal symptoms and identify the best treatment. This can be time consuming and challenging for clinicians to perform, and appears to be rarely done in clinical practice. Decision support tools can more rationally use available resources by shifting responsibilities away from those least able to perform them towards those most appropriate to perform them. The Internet presents new opportunities for delivering and disseminating individualized decision support tools that can help with menopausal counseling. A web-based decision support tool, Women's Interactive System about Decision On Menopause (WISDOM), was designed to improve the quality of treatment decisions around menopause and HT by providing individualized information about the impact of menopausal treatments on symptoms and risks.

Preliminary trial results suggest a positive impact on clinicians and patients. The unique challenges and opportunities in developing and testing web-based decision support tools are discussed.

Using Computer Simulations in Behavior Therapy Training:

Describes 4 computerized case simulations designed for use as an adjunct to behavior therapy training. The cases simulate the assessment, diagnostic, and treatment decision-making processes involved in treating various clinical problems: agoraphobia, chronic headache pain, bulimia, and cocaine abuse, from a behavioral perspective. Initial information for 3 simulations tested with 25 user within a Clinical Psychology doctoral program and a Master of Social Work program, and structured evaluations of the simulations by the Ss in each program are also discussed. The Ss perceived the simulations as useful in developing skills necessary for the appropriate application of behavioral techniques. Suggestions are offered concerning how simulations of this type may be integrated into both lecture and practicum courses.

Business Models for E-Learning: E(Electronic)-learning becomes more and more important. Reasons are the paramount importance of knowledge, life-time learning, globalization and mobility. Not all providers of e-learning products succeed in closing the gap between production costs and revenues. Especially in the academic sector e-learning projects suffer more and more from decreasing funding. For many currently active research groups it is essential to market their research results, e. g. e-learning applications, in order to fund actual and future e-learning projects. Basis of a successful commercialization of e-learning products is a coherent and consistent overall e-learning strategy. E-learning strategies have to address economical, pedagogical and technological goals. For ensuring pedagogical and technological quality, different theories and models for e-learning already exist, e. g. the Essen Learning Model (ELM). But there is a lack of theories and models ensuring economical quality in terms of marketable and sustainable products. This

paper presents a framework for e-learning business models. Its advantage is its suitability for products designed for computer based training (CBT) as well as for web based (WBT) or mobile based training (MBT). The framework is suitable to complete existing e-learning theories and models focusing the pedagogical and technological dimension of e-learning. According to this new approach sustainable business models for e-learning integrate and consolidate strategic propositions concerning market model, activity model and asset model. By analyzing these issues, crucial success factors for the commercialization of e-learning products are identified. Additionally, successful relations between core activities and revenue models are presented.

III. METHODS AND MATERIAL

Proposed system:

To overcome the problem with an existing system, we have developed a web application for student counselling through online.

Figure 1: Block diagram

3. Implementation:

The project was carried out using the below listed modules.

1. Admin
2. User
3. Employee

1. Admin

1.1 Login: Admin can login into application with valid credentials.

1.2 Add Counselling persons: Admin can add the counselling persons into account.

1.3 Remove Persons: Admin can remove (delete) the persons from online counselling system.

1.4 Add Counselling details: Admin can add the Counselling details such as Eamcet, PGcet, Polycet and Adhaar card, ration card, Voter ID, Photo, SSC, Intermediate marks cards. Admin also can add the counselling timings like starting and ending times.

2. User

2.1 Register: User can register with required details, after added by admin.

2.2 Login: user can login with valid credentials.

2.3 View Counselling Information: Here the user can view the counselling information.

2.4 Upload files: User can upload the required documents as per counselling information.

3. Employee

3.1 Login: Employee can Login with valid Credentials to the application.

3.2 View users Documents: Employee can view the all documents which is up-loaded by the users as per counselling instructions.

3.3 Download files: Employee can download the user files (documents).

3.4 Send reply: Employee can send the reply to users about the college selection acceptance.

IV. CONCLUSION

In this project, we have developed a user friendly application called Online Counseling System that is beneficial to users. The admin can add and remove counselling folks in this application, as well as add counselling details such as Eamcet, PGcet, Polycet, and Adhaar card, ration card, Voter ID, Photo, SSC, and Intermediate marks cards. Counselling timings, such as start and end hours, can also be added by the administrator. The administrator can add users and employees. Users can access the counselling information and upload papers. Employees can share college information with users here.
